job_search_agent_v2

WORKFLOW

01
Search
The AI searches for you on a schedule.

02
Review
Apply or Skip each job.

03
Generate
Get a folder for each Apply.

04
Edit
Check resume changes in Word.

05
Apply
Submit, then update the Tracking Sheet.

06
Refine
Teach the AI. Every week or two.

Start here

Open **Terminal** → `go-jsa` → press **Return**

Then type the commands below. **Ctrl-C** stops anything, and your work so far stays saved.

Your files

In the `profile` folder.

The search
`search/`

What the AI search looks for, in plain sentences. After editing, run:

```
uv run jsa deploy
```

Your resume
`resume.docx`

The starting point for every job. Type `[COMPANY]`, `[TITLE]` or `[DATE]` to have them filled in.

Your cover letter (optional)
`cover_letter.docx`

Copied into every job's folder, with a PDF. The same placeholders work here. The AI never rewrites it.

Your skills
`resume_skills.md`

Skills you really have, one per line or separated by commas. The AI may add these to a resume.

02 Review

```
uv run jsa review
```

Each new job opens in Chrome. Read it, then answer in Terminal.

`a` Apply `s` Skip `b` Back `q` Quit

Then type one sentence on why. The search learns from it.

```
Acme — Communications Manager
Location: Remote (US)
Decision [a/s/b/q]: s
Feedback (…): Great mission, but the salary is too low
```

Changed your mind later? `uv run jsa revise --last`

+ Add a job

```
uv run jsa add <link>
```

Use the employer's own link, not LinkedIn or Indeed.

Check the company and title, then press Return.

"Use this posting to refine the search?" Press Return if you want more jobs like it. Type n for a one-off.

It's marked Apply, so it skips review. Run Generate to make its folder.

03 Generate

```
uv run jsa generate
```

Makes a folder for each Apply in **Documents › Job Applications** and adds it to your Tracking Sheet.

LOOK AT THE RESUME FILES IN THE FOLDER

`.docx + .pdf`

Ready. Send the PDF.

`.docx only`

Changes to check. See 04.

If it says `no job description`, the AI couldn't read that posting. Paste the posting into a plain-text file named `job_posting.md` in its folder, then run the command it shows, starting with `uv run`.

04 Edit in Word

1. Open the `.docx`. **Review** tab.
2. **Accept** or **Reject** each change. Its comment says why.
3. Delete the comments.
4. **File › Save As › PDF,** choosing **Best for electronic distribution** so links keep working. Send that.

Communications Manager, Northwind Foundation

- Wrote ~~newsletters~~ donor newsletters for 40,000 readers [1]
- Ran the organization's social media [2]
- ~~Planned weekly staff meetings~~ [3]

1 Posting: "donor newsletters"
Uses the job's own words.

2 **For you to decide; this is not a change.**
Name Instagram here, if true.

3 Posting: "external communications"
Internal work distracts here.

1 **A change.** Accept or reject.

2 **A question.** Your call.

3 **A removal.** Reject to keep it.

05 Apply

Submit, then fill in your two columns in the Tracking Sheet.

COMPANY	TITLE	ADDED	DATE APPLIED	STATUS
Acme	Communications Manager	Oct 21	**Oct 23**	**Applied** ▾

THE AI FILLS THE REST. YOU FILL THE RED COLUMNS.

06 Refine

```
uv run jsa refine
```

1. Open the `profile/refine` folder. Each file is one of your search files, with the AI's suggestions marked.
2. Fix each marked block, and save.
3. When every block is fixed:
   `uv run jsa refine --accept`
   `uv run jsa deploy`

A MARKED BLOCK

```
<<<<<<< current      ← what the search uses now
- Communications Manager
=======
- Communications Manager, nonprofit or public sector
>>>>>>> proposed     ← the AI's suggestion
```

Keep one side, or write your own. Then delete the three marker lines:

```
- Communications Manager, nonprofit or public sector
```

To throw out the whole suggestion instead: `uv run jsa refine --reject`
